

COURTEENHALL ESTATE BEEF PRODUCTION

Part of our regenerative farming system

Grazing outdoors 365 days a year

A low input system where the cattle graze on grass rather than concentrates

1 hectare of grass per cow

Traditional Hereford Cattle have been grazing the parkland at Courteenhall for many generations

Nutrients from cow manure (like Nitrogen and Sulphur) can support grass growth

Over 250 different species of insects can live in cow manure, which helps with biodiversity, feeding the many mammals and birds that eat them

An increase of organic matter into the soil from cow manure can help to absorb / store more carbon

Our beef will be sold through our own farm shop to serve the local community and through collaboration with the Ethical Butcher
